FOR IMMEDIATE RELEASE

November 14, 2017

Reach Technologies Inc. announces the award, delivery and acceptance of six (6) ship-borne Acoustic Data Recorders to the Canadian Navy. These NATO TEMPEST qualified units record, analyze and play acoustic analog signals in support of subsurface defense operations; and will be immediately installed onboard their Halifax class frigates, to address some long outstanding recording technology deficiencies.

Commenting on the procurement, Bradley Higgin, Senior Systems Engineer and Director of Reach Technologies stated, "As a small Canadian company, we're very proud of the continued partnership with our DND. We've had a great relationship with our Navy over the years, and their continued interest in sourcing domestic innovations will have a very positive economic impact for all Canadians."

Reach Technologies (est. 1993) specializes in the development and manufacture of data acquisition, precision timing, and test equipment for the aerospace, automotive, defense, and energy industries.
