## **FOR IMMEDIATE RELEASE**

February 27, 2018

Reach Technologies Inc. announces the award of an additional eight (8) ship-borne Acoustic Data Recorders to the Canadian Navy. These NATO TEMPEST certified units record, analyze and play acoustic analog signals in support of anti-submarine warfare operations; and will be immediately installed onboard their Halifax-class frigates, to address some long outstanding recording technology deficiencies.

Commenting on the procurement, Bradley Higgin, Director of Business Development at Reach Technologies stated, "Our relationship with our Navy over this past decade has been very constructive, and we're proud to be a part of the defense of our nation. We're excited to complete our portion of the Halifax-class modernization project, and support these systems for the remainder of their service."

Reach Technologies (est. 1993) specializes in the development and manufacture of rugged data acquisition, precision timing, and test equipment for the aerospace, automotive, defense, and energy industries.
